Web Portfolio Assignment

A web container version of a simple HTTP server and stock portfolio site.

Made for 159.352 Advanced Web Development at Massey University April 2022 by Joshua Pearson.

Welcome to your stock portfolio and research centre, Josh

Use the links on the bar above to view and update your portfolio, or access your research centre.

Demo

<https://jp159352.herokuapp.com/>

username and password: 20019455

See run locally for information on how to launch and use the server locally.

Home page

This page contains almost nothing. I chose to have this page be built and set up with the navigation bar in order for a user to quickly access the two pages.

Click one of the two links: Portfolio or Research to get started.

Portfolio

Home	Portfolio	Research
------	-----------	----------

Josh's Investment Portfolio

Data provided by IEX Cloud

Stock	Quantity	Price	Gain/Loss
AAPL	52.0	151.42	6.85%
GOOG	1013.0	2245.39	6.54%

Stock Symbol:

Quantity:

Share price: \$

Reset

Update

On this page, you have a few elements including:

- A navigation bar at the top, indicating the current page we are one.
- A disclaimer link showing where we retrieve price and symbol data required by IEX.

- A portfolio containing the ticker, number, and average price of each share of a stock we own.
- A live calculation displaying the gain or loss we have made purchasing and holding the shares of each stock in the portfolio.
- Form input with autocomplete stock name, quantity, and prices with error handling on input.
- A reset button that clears the user input from the form.
- Space below the buttons will display any user relevant messages after they press update.

Research

Josh's Stock Research Centre

Data provided by IEX Cloud

Stock Symbol:

Symbol: TSLA

Company Name: Tesla Inc

PE ratio: 120.1019

Market Capitalization: 1,009,336,389,503

52 week high: 1243.49

52 week low: 546.98

Range From To

On this page, the elements are simpler before pressing research. We have:

- An input box where the user can select (with autocomplete) a stock to research.
- Once submitted if the user enters a valid stock, you will see the stock information and a chart of the last 5 years of stock history. Note the chart defaults to only viewing 1 year data in the window for cleaner views but there are range buttons above the chart and a bar below to finetune the viewing window.

Also, note that the chart uses CanvasJS free which is technically only valid for free for 30 days so this may stop working at any time.

Container and deployment info

This project was built almost exclusively using python 3.10. Once completed, I loaded this into a docker container and deployed it to Heroku. The dockerfile data is visible inside the repo but the relevant data is here:

```
FROM python:3.10.0a2-slim-buster
RUN pip3 install requests
COPY . /src
WORKDIR /src
CMD python server.py $PORT
```

The Dockerfile to run on Docker locally was changed to be:

```
FROM python:3.10.0a2-slim-buster
RUN pip3 install requests
```

```
COPY . /src
WORKDIR /src
EXPOSE 8080
CMD python server.py 8080
```

We use \$PORT to allow Heroku on deployment to select the port used for hosting services.

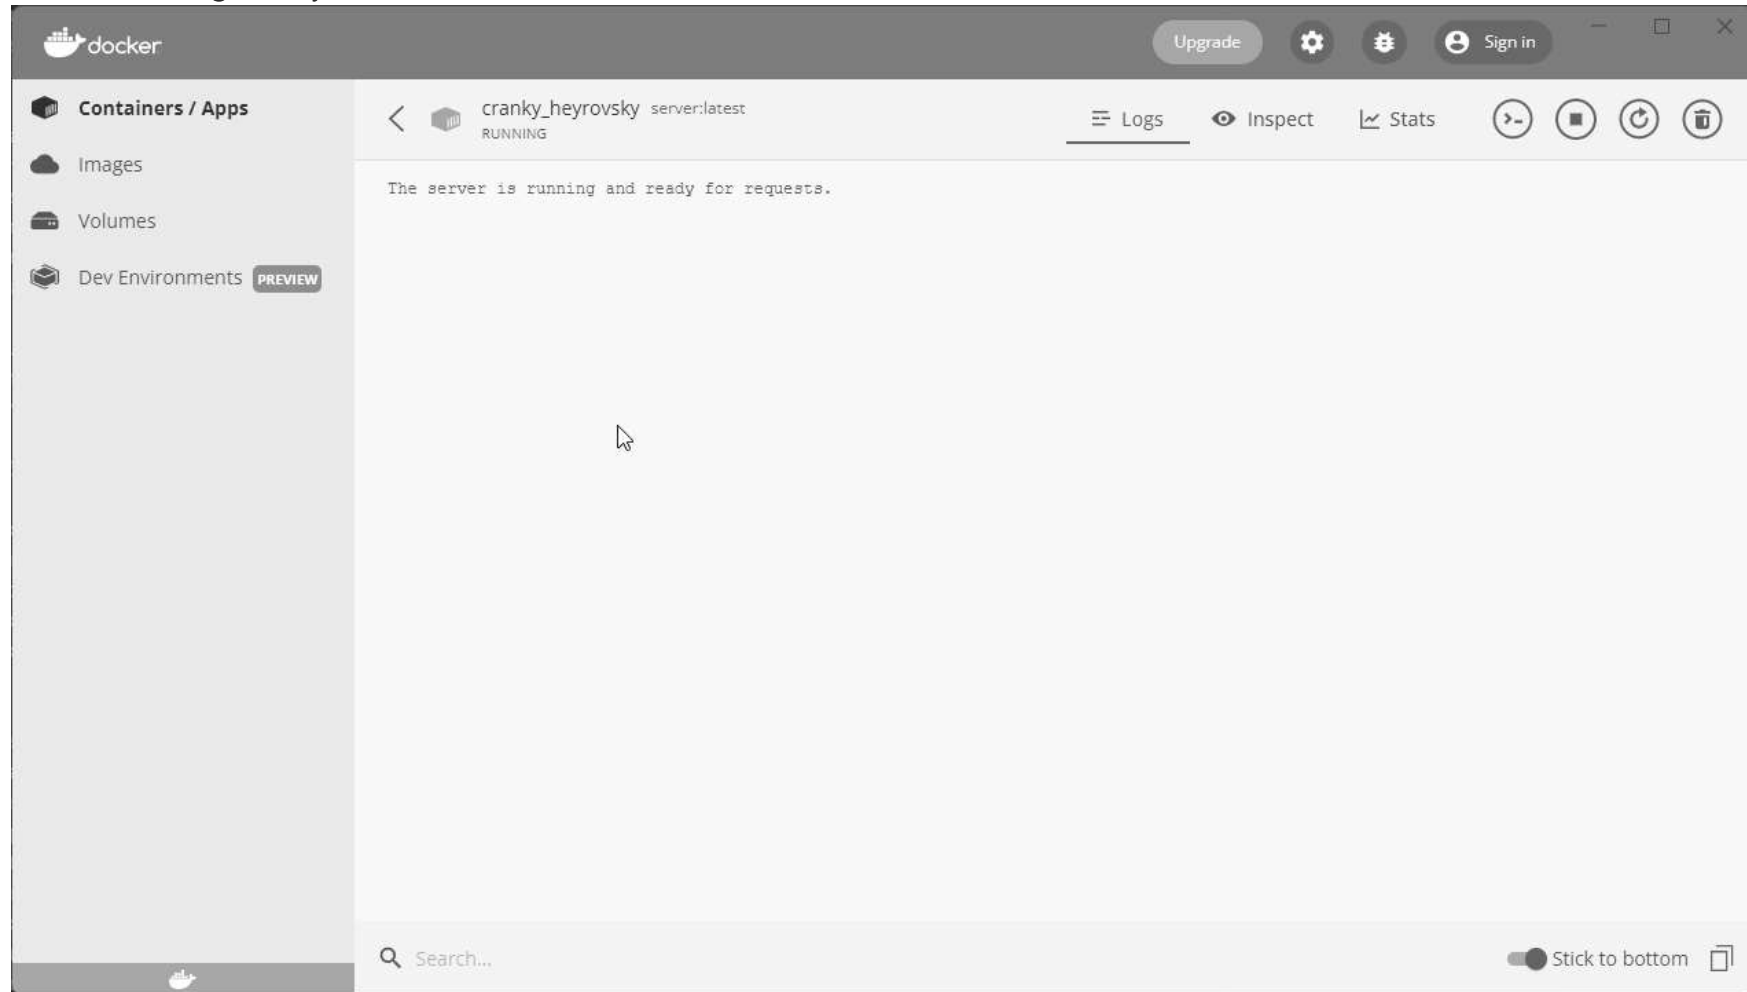

Some images of the process are below.

Command line:

```
C:\Users\Josh\Google Drive\Documents\Bachelor of Science\Semester 4 (2022 Autumn)\159352 Advanced Web Development\Assignments\
Assignment 1>docker build -t server:latest .
[+] Building 3.6s (13/13) FINISHED
=> [internal] load build definition from Dockerfile                                0.0s
=> => transferring dockerfile: 190B                                              0.0s
=> [internal] load .dockerignore                                                  0.0s
=> => transferring context: 2B                                                  0.0s
=> resolve image config for docker.io/docker/dockerfile:1                      1.7s

=> CACHED [2/4] RUN pip3 install requests                                        0.0s
=> [3/4] COPY . /src                                                            0.2s
=> [4/4] WORKDIR /src                                                            0.0s
=> exporting to image                                                            0.1s
=> => exporting layers                                                            0.1s
=> => writing image sha256:678ba38243481ca45d88a28242c14ecc5236ac576d765bc8ecc8e7374ea28c22 0.0s
=> => naming to docker.io/library/server:latest                                0.0s

Use 'docker scan' to run Snyk tests against images to find vulnerabilities and learn how to fix them
```

Docker running locally:

Accessible and working completely on localhost:8080

Run Locally

- *Clone the project from Github*

```
git clone https://github.com/baconeta/159352-assignment1
```

Go to the project directory

```
cd assignment1
```

Install dependencies

```
pip3 install requests
```

Start the server (you should confirm that line 25 is commented out and line 26 is uncommented unless running in a Docker container - see below for more info)

```
python3 server.py
```

- *Run locally without cloning from git repo*

In your local environment or IDE ensure you have the requests library installed (consider using pip3 install requests)

Otherwise similarly to above using the command line:

Go to the project directory

```
cd assignment1
```

Install dependencies

```
pip3 install requests
```

Start the server. You can also skip this cmd line command and instead run it in an anaconda or venv environment inside your IDE and run the server file manually.

```
python3 server.py
```

Make sure the following code is set correctly otherwise ensure you pass the port argument into the run command. Docker and Heroku require the sys argument instead to be uncommented as it is in the repo version of server.py.

```
# serverPort = int(sys.argv[1])
serverPort = 8080
serverSocket.setsockopt(SOL_SOCKET, SO_REUSEADDR, 1)
```

Once the server is running using either method you can access the the locally hosted site using: <http://localhost:8080/>

Tech Stack

Server:

Python 3.10 using the following main modules

- requests
- *base64 core builtin*
- *socket core builtin*

Docker container

- Docker version 20.10.14, build a224086
- Docker Desktop 4.7.1 (77678)

Heroku

- heroku/7.60.1 win32-x64 node-v14.19.0
- config: web /bin/sh -c python\ server.py\ \$PORT

App Name

jp159352

Region

 Europe
